

Hamming Code ECC, 1bit correction, 2bit detection

Hamming Code ECC has:

No iterative feedback in pipeline.

Encoder:

The input message bit width is programmable when RTL is generated. The Encoder adds ECC bits to the message in systematic way.

Decoder:

The decoder takes in message bits and ECC bits with some bits getting corrupted due to channel errors. The Hamming Code ECC will correct 1 bit error and detect 2 bit errors. It indicates if there was an uncorrectable error, and corrects the data on 1 bit error
